**Saving American Hearts
2015 NRP Study Guide**
2011, 6th Edition Neonatal Resuscitation Provider Manual

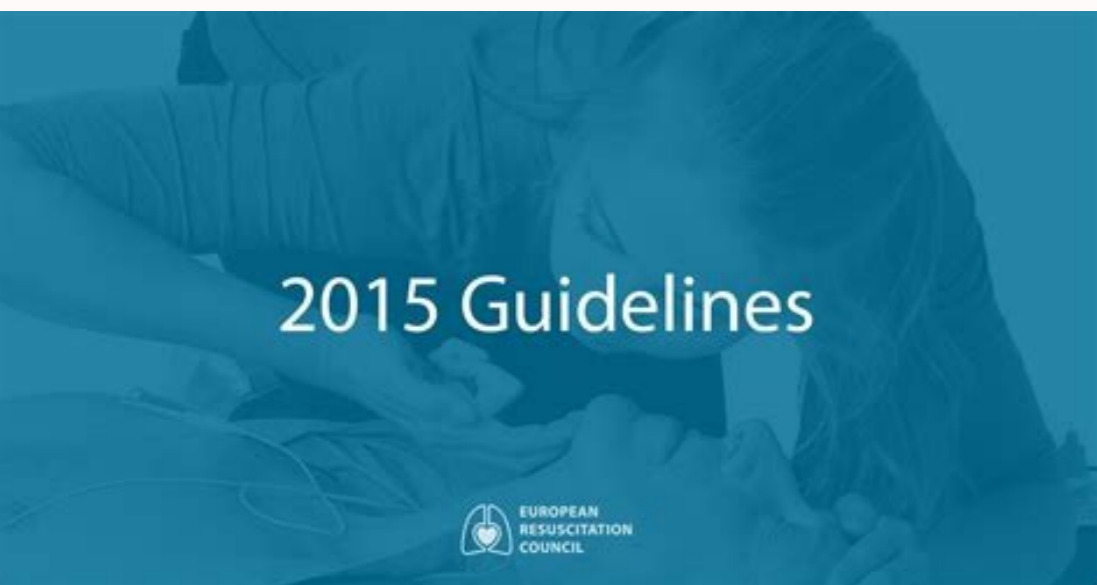

Saving American Hearts
ACLS EP ACLS NRP PALS
BLS

6165 Lehman Dr. Colorado Springs
Suite 209 Colorado
Colorado Springs (719) 531-1222
www.savingamericanhearts.com

There are 9 lessons in the 2011 6th edition of the Online Neonatal Resuscitation Program.

- Lesson 1 – Overview and Principles of Resuscitation
- Lesson 2 – Initial Steps in Resuscitation
- Lesson 3 – Use of the Resuscitation Devices with PPV
- Lesson 4 – Chest Compressions
- Lesson 5 – Endotracheal Intubation
- Lesson 6 – Medications
- Lesson 7 – Special Considerations
- Lesson 8 – Resuscitation of Babies Born Preterm
- Lesson 9 – Ethics and Care of the End of Life.

The NRP Provider Course consists of the above 9 lessons; however, you will need to only need to complete those lessons required by your facility or level of expertise. Children's Hospital Employees are required to complete all 9 lessons. Other facilities only require that you take the mandatory lessons to obtain your provider card. The mandatory lessons are Lessons 1, 2, 3, 4 and 9. Do not do lessons 5, 6, 7 or 8 unless your facility requires them, or you would like to voluntarily take them to gain more knowledge. From my experience, I suggest you take them all, especially if you are a travel nurse and or work in more than one hospital.

The use of up to three-stacked shocks may be considered only if initial ventricular fibrillation/pulseless ventricular tachycardia (VF/pVT) occurs during a witnessed, monitored cardiac arrest with a defibrillator immediately available e.g. during cardiac catheterisation or in a high-dependency area. Start ALS as early as possible. Use waveform capnography to monitor the quality of CPR. Hospital staff should use structured communication tools to ensure effective handover of information. Give a shock as early as possible when appropriate. Mechanical chest compression devices Consider mechanical chest compressions only if high-quality manual chest compression is not practical or compromises provider safety. Thrombolytic drugs Consider thrombolytic drug therapy when pulmonary embolus is the suspected or confirmed as the cause of cardiac arrest. Right ventricular dilation in isolation during cardiac arrest should not be used to diagnose massive pulmonary embolism. This includes calls based on clinical concern, rather than solely on vital signs. If treatment with atropine is ineffective, consider second line drugs. Use of ultrasound imaging during advanced life support Only skilled operators should use intra-arrest point-of-care ultrasound (POCUS). Antero-lateral pad position is the position of choice for initial pad placement. Conscious patients require anaesthesia or sedation, before attempting synchronised cardioversion. Hospitals should train staff in the recognition, monitoring and immediate care of the acutely ill patient. During manual chest compressions, 'hands-on' defibrillation, even when wearing clinical gloves, is a risk to the rescuer. These plans should be recorded in a consistent manner (See Ethics section). Adult patients with non-traumatic OHCA should be considered for transport to a recognised centre of care for appropriate specialist treatment, according to local protocols. Use waveform capnography to confirm tracheal tube position. It is an essential resource for all healthcare professionals providing resuscitation or intensive care to complex small, sick babies. Please note: this item is currently available to pre-order. Use direct or video laryngoscopy for tracheal intubation according to local protocols and rescuer experience. If transcutaneous pacing is ineffective, consider transvenous pacing. Ventilator circuits should remain attached. It follows the 2021 UK Resuscitation Guidelines (developed using a process approved by NICE) and is the core reading for the RCUK Newborn Life Support (NLS) course. Once a tracheal tube or a supraglottic airway (SGA) has been inserted, ventilate the lungs at a rate of 10 min-1 and continue chest compressions without pausing during ventilations. Do not use POCUS for assessing contractility of the myocardium as a sole indicator for terminating CPR. Lidocaine 100 mg IV (IO) may be used as an alternative if amiodarone is not available or a local decision has been made to use lidocaine instead of amiodarone. The expert consensus is that a high success rate is over 95% within two attempts at intubation. It follows the 2021 UK Resuscitation Guidelines (developed using a process approved by NICE) and is the core reading for the RCUK Paediatric Immediate Life Support (PILS) course. Published: May 2021 Price: £15.00 (+0% VAT) ISBN: 978-1-903812-38-9 Format: A4 Book, 128 pages, full colour A guide to the basics of good teaching, covering both the theoretical background and practical skills. Do not give atropine to patients with cardiac transplants – it can cause a high-degree AV block or even sinus arrest – use aminophylline. To convert atrial or ventricular tachyarrhythmias, the shock must be synchronised to occur with the R wave of the electrocardiogram (ECG). Published: May 2021 Price: £45.00 (+0% VAT) ISBN: 978-1-903812-35-8 Format: A4 Book, 228 pages, full colour Provides clear, practical guidance on the recognition and management of neonatal emergencies at birth and on the neonatal unit. An additional bolus of lidocaine 50 mg can also be given after five defibrillation attempts. A shock can be safely delivered without interrupting mechanical chest compression. Consider giving glucagon if beta-blockers or calcium channel blockers are a potential cause of the bradycardia. The loading dose of amiodarone can be followed by an infusion of 900 mg over 24 hours. Hospital systems should aim to recognise cardiac arrest, start CPR immediately, and defibrillate rapidly (8 cm away from the device, or use an alternative pad position. It follows the 2021 UK Resuscitation Guidelines (which have been developed using a process approved by NICE) and forms the core reading material for Candidates taking the Resuscitation Council UK Advanced Life Support (ALS) course. Waveform capnography during advanced life support Use waveform capnography to confirm correct tracheal tube placement during CPR. It follows the 2021 UK Resuscitation Guidelines (developed using a process approved by NICE) and is the core reading for the RCUK ARNI course. When a mechanical chest compression device is used, minimise interruptions to chest compression during device use by using only trained teams familiar with the device. Bradycardia If bradycardia is accompanied by life-threatening adverse signs, give atropine 500 mcg IV (IO) and, if necessary, repeat every 3-5 minutes to a total of 3 mg. eBooks Many Wiley-Blackwell titles are available digitally for download onto your computer, laptop or mobile device, or can be accessed 24/7 on Wiley Online Library. High-quality photos and illustrations are accompanied by step-by-step instructions to guide the reader through the key interventions involved in resuscitation. It despatches from 23 June 2021. It includes foam nose and forehead protectors for comfort, and an adjustable Velcro strap makes it suitable for different ages. Hospitals should use a track and trigger early warning score system for the early identification of patients who are critically ill or at risk of clinical deterioration. This led to the International Liaison Committee on Resuscitation (ILCOR) Consensus on Cardiopulmonary Resuscitation and Emergency Cardiovascular Care Science with Treatment Recommendations. The involvement of stakeholders from around the world including members of the public and cardiac arrest survivors. Details of the guidelines development process can be found in the Resuscitation Council UK Guidelines Development Process Manual. RCUK supports shared decision making and advanced care planning which integrates resuscitation decisions with emergency care treatment plans to increase clarity of treatment goals and also prevent inadvertent deprivation of other indicated treatments, besides CPR. Give the highest feasible inspired oxygen during CPR. The manual also provides comprehensive referencing to allow NLS providers to explore the science behind the resuscitation guidelines. Hospitals should standardise resuscitation equipment. Adult patients with a cardiac arrest of presumed primary cardiac aetiology should be transported directly to a hospital with 24/7 coronary angiography capability. Consider amiodarone for acute heart rate control in AF patients with haemodynamic instability and severely reduced left ventricular ejection fraction (LVEF). For atrial fibrillation: An initial synchronised shock at maximum defibrillator output rather than an escalating approach is a reasonable strategy based on current data. With a SCA, if gas leakage results in inadequate ventilation, pause compressions for ventilation using a compression-ventilation ratio of 30:2. Guidelines 2021 are based on the International Liaison Committee on Resuscitation 2020 Consensus on Science and Treatment Recommendations for Advanced Life Support and the European Resuscitation Council Guidelines for Resuscitation (2021) Advanced Life Support. Add digoxin if necessary. Hospitals should use a standard "Cardiac Arrest Call" telephone number (2222). Identification of individuals with inherited conditions and screening of family members can help prevent deaths in young people with inherited heart disorders. The resuscitation team should meet at the beginning of each shift for introductions and allocation of team roles.
